COPPER FLARED LUGS

The range of flared copper lugs has been designed with the barrel entry flared to enable an easy insertion of multi stranded cables (flexible cable). The range of connectors (from 25mm² to 185mm²) will ensure most applications for the common flexible cable sizes are covered. The flared copper lugs are made from seamless copper tube, electro tin plated and have the cable area clearly marked on the palm of the lug. The inspection window on the barrel provides a check that the cable has been fully inserted. The flared lugs can be crimped with the standard range of Utilux tooling and hexagonal dies.

SOLID PALM COPPER LUGS

Utilux have introduced a range of small copper lugs to be used in heavy industry. The range of connectors (6sqmm to 35sqmm) compliments the existing larger size copper cast lugs. The lugs are fabricated from copper rod to maximise the strength. They are made without a seam in the palm, with an increased wall thickness and electro-tinned plated. The solid palm also eliminates the ingress of moisture which makes them suitable for outdoor use. Crimping has been rationalised so that only two (2) sets of dies are required to terminate the full range of lugs.

CCT CONDUCTOR

The new aluminium lugs & links are designed for use with 7/2.75 (40mmsq) Aluminium CCT conductor.

The lug is primarily used on dropper cables for pole mounted substations. An aluminium link is also provided for in line connections.

The lug and link are manufactured from 99.9% pure high conductivity aluminium. They are forged to maximise conductivity and strength.

The solid palm also eliminates the ingress of moisture whilst the plating gives added protection for outdoor use.

The lug and link are pre-filled with jointing compound, ink stamped with catalogue number and crimping details and individually packed in sealed plastic bags.

A NEW SOLUTION FOR CONNECTING UNDERGROUND ALUMINIUM CABLES

This new range of connectors for aluminium 4 core sector cable features a unique concept enabling the lug to be rotated to any desired position on the conductor, without the need to round the conductor first. The design embodies the tried and proven round barrel/hex compression die combination, giving superior connection reliability.

BENEFITS:

- The lug can be rotated to any desired position
- No need to twist conductor to correct orientation

- Minimum effort required to correctly orientate lug
- Reduces total connection time
- Suits solid and stranded conductor types
- Uses standard size hexagonal dies
- No need to round the sector cable first
- Bi-metal versions available
- No voids when crimped
- Takes two crimps on the barrel without overlapping
- Palm will fit into most receptacles found in URD system
- Supplied pre-packed with jointing compound, in sealed plastic bags
- The lug barrel has markings showing the length of insulation to be stripped
- Made from high conductivity, high strength, solid forged aluminium
- Tested to BS4579

ROTATING BI-METAL LUGS & LINK

This new range of connectors for aluminium 4 core sector cable features a unique concept enabling the lug to be rotated to any desired position on the conductor, without the need to round the conductor first. The design embodies the tried and proven round barrel/hex compression die combination, giving superior connection reliability.

BENEFITS:

- The lug can be rotated to any desired position
 - No voids when crimped
- No need to twist conductor to correct orientation
- Takes two crimps on the barrel without overlapping
- Minimum effort required to correctly orientate lug
- Palm will fit into most receptacles found in URD system
 - Reduces total connection time
- Supplied pre-packed with jointing compound, in sealed plastic bags
 - Suits solid and standard conductor types
- The lug barrel has markings showing the length of insulation to be stripped
 - Uses standard size hexagonal dies
- Made from high conductivity, high strength, solid forged aluminium
 - No need to round the sector cable first
 - Tested to BS4579

HEAVY DUTY HAND OPERATED HYDRAULIC CRIMP TOOLS

The precision engineered hydraulic components used in these tools set the standard which others strive to achieve, and the user benefits from faster crimp times, less handle effort, easier maintenance, longer tool life and more dependable results.

The two stage pumping mechanism in selected products means the ram advances quickly up to the connector, then slows as the hydraulic effort is translated into crimping force. Automatic by-pass valves, provide positive feedback to the user when the tool has reached its rated output, and the crimp is complete.

CRIMPING DIES

Utilux crimping dies for aluminium and copper connectors are precision engineered from EN26 high tensile steel, oil hardened to 50-52 Rockwell C, ensuring long life and minimal die wear. Each hexagon die set is engraved with "Utilux" on one of the die faces, and the die part number on the other, leaving an indent on the crimp for easy inspection and verification.

THE RANGE OF DIES INCLUDES:

- Hexagonal die sets for precision crimping of copper and aluminium connectors
 - Nest and indent die sets for special aluminium applications
 - Special 'steel' dies for crimping steel sleeves

The selection of the die type required depends on the connector to be crimped, and the tool to be used.

CABLE HOLDERS

FUNCTION: For securing electrical cable from a diameter of 30mm up to 100mm, to a power pole or beam.

DESIGN FEATURES: The design of the cable holder allows for a variety of sizes of cable, due to the variable adjustment and locking points.

The unique design features of the cable holder are the:

- Dual support legs which allow for dual fixing to a pole
- Optional fixing methods, either using a bolt or bandclamp strapping

MATERIAL: The clamp body is made from mild steel, which has been blanked and formed, then hot-dip galvanised.

- The strap is made from 304 grade stainless steel.
- The pin is zinc diecast.

MARKETS: The clamp has applications in power authorities, mining, railways, building and construction.

ADDITIONAL INFORMATION: A variation to this product is a vertical version, where the fixing points run parallel to the stainless steel strap.

COMPRESSION TERMINATION THEORY

Utilux crimp lugs, links and stalk lugs are designed to be compatible with Utilux indent tools and hydraulic tools with hexagonal or indent dies. Through this exact matching the resultant terminations achieve a consistently precise compression – neither over stressed nor understressed – to produce the correct indent or hexagonal force.

The crimp is designed to bring all conductors and the connector itself into intimate contact. At the same time, the crimp is designed to avoid any reduction in the cross sectional area of the conductor, with an increased contact area.

BASIC COMPRESSION TERMINATION PRACTICES

1. Strip the cable insulation to the recommended length. Recommended stripping lengths of conductors should correspond to the barrel lengths shown in this catalogue.
2. With non plated copper conductors, scratch brushing may be carried out on the bare copper conductor. On aluminium conductors however, scratch brushing must be carried out. Terminating should be completed as soon as possible after stripping of the insulation.
3. To ensure a reliable termination, the correct connector for a given cable size must be selected. Moreover, the recommended indent tool or hexagon tool and die must also be used. See the various data tables in this catalogue for tooling recommendations.
4. Fit the connector over the stripped conductor and place the connector into the hand or hydraulic tool. Apply the recommended pressure. With hand tools, the crimp is not complete until the jaws meet or the ratchet releases. With hex dies in hydraulic tools, the faces of the die must meet.
5. The number of crimps per connector can vary. Some lugs have markings for crimps, if you require more information please contact Utilux.

TERMINATION RECOMMENDATIONS

The palm contact areas of Utilux lugs are designed to give more than that the surface of lugs are used upon has corresponding contact area. Excessive drilling out of palm holes must be avoided, to ensure that adequate palm contact, heavy gauge washers are recommended. In relation to stalk lugs and consistent with the above, care must be taken to adequately match the stalk diameter of the tunnel or mounting connector, to ensure maximum surface contact area. Bolting torques are listed in the following table.

Bolt Size	Material	Tightening Torque

1/2"	Aluminium	40 Newton Metres
M10	Aluminium	20 Newton Metres
M6	Steel	16 Newton Metres

FLEXIBLE CABLE CRIMPING

The crimping of connectors onto flexible conductors is problematic due to the large amount of air gaps between conductor strands. This results in a large physical size for a relatively small conductor cross section. Thus the standard size lug for a given area of flexible conductor is usually too small. If a larger size lug is used instead, the standard die for that size lug will not achieve the desired compression.

Indent crimping is not recommended, as the indent may damage the very fine strands of a flexible conductor which may in turn cause connector failure.

Adopting the Utilux "Half Hex" crimping method solves the problem.

This method employs a crimping shape in the form of one half of the standard hexagon shape. The dies used comprise a normal hexagon crimp die, along with a special flat die to give the half hexagon shape. The hexagon die is sufficiently large to close around the lug completely, giving adequate compression.

Normally the conductor's area will be known or can be located on the chart below. However if not known, it has to be established. To do this we require the amount of strands and individual strand diameter. Counting the amount of strands is not as daunting a task as it appears. The lay of the conductor will generally be a series of bundled strands, with each bundle having the same lay as a regular laid conductor, eg 7, 19, 37 strands etc. Having established the amount of strands to a bundle, count the amount of bundles and multiply. For example for a 95mm² the conductor may be 259/0.7 with a nominal diameter of 13.8mm, from this the true area is 99.7mm². The diameter is too large for a 95mm² barrel but will fit a 120mm² barrel. It can then be crimped using the half hex method.

Rule of thumb for matching conductor to lug, providing conductor diameter allows, is whatever the area of the conductor, choose the next size larger lug.

1. Refer to pages 2 & 3 for copper lug descriptive part numbers
2. To calculate cross sectional area of cable, use following formula;

$$CSA = \frac{N \times d^2 \times \pi}{4}$$

METRIC DESCRIPTION

For simplicity in identifying connectors in this catalogue, we have designated certain products with metric coding.

This coding can be used to identify a product if the Utilux catalogue number is unknown.

The following coding applies:

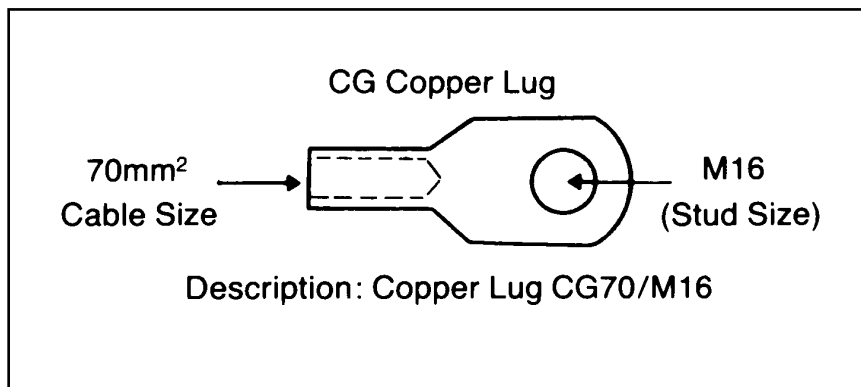

A = Aluminium	K = Link
B = Bi-Metal	S = Sector
C = Copper	M = Palm Hole in mm
G = Lug	MB = Blank Palm
AGS = Aluminium Lug Sector	
AKS = Aluminium Link Sector	
BGS = Bi-Metal Lug Sector	
BKS = Bi-Metal Link Sector	
AG = Aluminium Lug	AK = Aluminium Link
BG = Bi-Metal Lug	BK = Bi-Metal Link
BS = Bi-Metal Stalk	CG = Copper Lug
CK = Copper Link	

The cable area in sqmm and the palm hole is included to complete the description, eg:

(a) BKS70/50 is a Bi-Metal Link Sector, 70mm² solid aluminium to 50mm² stranded copper.

(b) AGS300/M16 is an Aluminium Lug Sector Cable 300mm² solid 16mm palm hole.

(c) AKS240 is an Aluminium Link Sector Cable 240mm² solid.

Note: This guide covers a wide, but not exhaustive, range of our products. If you have a special requirement it may be available in our extensive non standard range or, through our Utilux Express service. Please discuss with your Utilux distributor.

ERGONOMIC DESIGN –

THE KEY TO SAFE, COMFORTABLE WORK PRACTICE

Poorly designed hand tools can often cause strain injury to the hands or lower arm and, at best, can make repetitive tasks tiring and uncomfortable. The Utilux range of Ergonomic Design Hand Crimp Tools combines high quality and durable design and manufacture with the best of current ergonomics science for optimal operator safety and comfort. These tools, developed in co-operation with prominent ergonomists, offer maximum performance and user-friendliness. Some important features are;

The optimum grip diameter is the width of the handles measured at the centre of the hand. Tools should be designed so that the maximum force needed is required at the optimum grip diameter.

The shape of the handles offers a comfortable one-hand grip even at maximum opening.

The unique mechanical advantage means that very small forces are required to crimp the connector and cable to fix them in the correct position.

When the connector and cable are fixed, the final crimping can be done with a comfortable two-hand grip.

GOOD MECHANICAL FUNCTION

The lower the hand force required to operate a tool, the lower is the risk of overloading and injury. Utilux Ergonomic Design Tools are equipped with a unique mechanism which reduces the need for muscle force by 45%.

OPTIMUM GRIP DIAMETER

The position at which the hand can transfer most force with minimal stress varies from individual to individual and is also significantly different between men and women. Utilux Ergonomic Design Tools feature handle designs that provide a comfortable optimum grip zone for any operator.

TWO HAND GRIP FEATURE

Our Ergonomic Design Tools feature handles which allow two-hand operation in the final, high force, crimping phase. This dramatically increases crimping force while reducing the possibility of strain or injury.

WEIGHT AND BALANCE

Low weight and good balance are an integral comfort and safety feature of Utilux Ergonomic Design Tools. Handles are precisely shaped to distribute the loading across the palm and four fingers rather than concentrating it on only a few fingers. This distributes surface pressure over the largest possible area of the hand.

HANDLE MATERIAL

Material used for handle grips is carefully selected to exhibit the correct co-efficient of friction when in contact with the skin. This reduces slippage and increases control.

THE HAND – A PRECISION TOOL

The human hand is a powerful, precision tool in its own right. It is our most important means of contact with the environment. But, like any precision instrument, it is sensitive to abuse. The use of quality ergonomically correct tools will help protect this most important part of the human body.
